
A Layered View Model for XML
with Conceptual and Logical Extensions,
and its Applications

Submitted by

Rajugan Rajagopalapillai

A thesis submitted in total fulfillment
of the requirements for the degree of
Doctor of Philosophy

Faculty of Information Technology

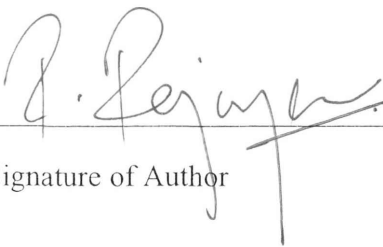

University of Technology, Sydney (UTS)
Sydney, NSW 2007
Australia

February 2006

CERTIFICATE OF AUTHORSHIP/ORIGINALITY

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of Author

Date: 16 / 02 / 2006

Acknowledgements

I am greatly indebted to my supervisors Professor Tharam Dillon, Professor Elizabeth Chang and Associate Professor Ling Feng for their encouragement and advice, and for providing constant direction and focus to my research. I owe my research achievements to their experienced supervision and unconstraint support.

I thank Professor Tharam S. Dillon for his step-by-step guidance, many hours of research discussions, suggestions, comments and kindhearted support during difficult times. I owe a big thank you to Professor Elizabeth Chang for her many years of unconstraint encouragement and support, patient discussions, motivating comments and advice. I thank Associated Professor Ling Feng for her invaluable suggestions, research discussions and comments on my research ideas and concepts. I am a much better researcher because of my supervisors' excellent guidance.

My thanks also go out to Associate Professor Wenny Rahayu for her help during my research years. I owe special round of thanks to my friends and colleagues at the Faculty of IT, UTS and at the Department of CS-CE, Latrobe University. I also thank Bruna Pomella for commenting ambiguous sentences and correcting grammatical mistakes.

Finally, I owe my success in life to the hard work and sacrifices of the two most important people in my life; Amma and Appa, my parents. I thank them for their unconstraint support and giving me the strength for letting my dream to come true.

Abstract

EXtensible Markup Language (XML) is becoming the dominant standard for storing, describing and interchanging data among various Enterprises Information Systems (EIS), web repositories and databases. With this increasing reliance on such self-describing, schema-based, semi-structured data language XML, there exists a need to model, design, and manipulate XML and associated semantics at a higher level of abstraction than at the instance level. However, existing OO conceptual modelling languages provide insufficient modelling constructs for utilizing XML structures, descriptions and constraints, and XML and associated schema languages lack the ability to provide higher levels of abstraction, such as conceptual models that are easily understood by humans. To this end, it is interesting to investigate conceptual and schema formalisms as a means of providing higher level semantics in the context of XML-related data modelling. In particular we note that there is a strong need to model views of XML repositories at the conceptual level. This is in contrast to the situation for views for the relational model which are generally defined at the implementation level.

In this research, we use XML view and introduce the Layered View Model (LVM, for short), a declarative conceptual framework for specifying and defining views at a higher level of abstraction. The views in the LVM are specified using explicit conceptual, logical and instance level semantics and provide declarative transformation between these levels of abstraction. For such a task, an elaborated and enhanced OO based modelling and transformation methodology is employed. The LVM framework leads to a number of interesting problems that are studied in this research. First we address the issue of conceptualizing the notion of views: the clear separation of

conceptual concerns from the implementation and data language concerns. Here, the LVM views are considered as *first-class citizens* of the *conceptual model*. Second we provide formal semantics and definitions to enforce representation, specification and definition of such views at the highest level of abstraction, the conceptual level. Third we address the issue of modelling and transformation of LVM views to the required level of abstraction, namely to the schema and instance levels. Finally, we apply LVM to real-world data modelling scenarios to develop other architectural frameworks in the domains such as dimensional XML data modelling, ontology views in the Semantic Web paradigm and modelling user-centred websites and web portals.

List of Publications

During this research, several sections of this research and collaborative works have been published. This includes refereed journal articles, book chapters and refereed international conference papers. Some of these selected published articles (marked with two **) are given in Appendix A.
